

UNI VFX 6D: Beams & Energy for Visual Effect Graph

Here you'll find details on this VFX Pack. For more information on setup etc. that is common to all UNI VFX 6D packs, see the **Manual** in the same folder.

List of all effects and events:

Looping effects with **OnPlay** and **OnStop** events: Obliteration Discharge, Energy Stream, Energy Vortex, Tear, Empowering Field, Tempest, Devastating Pulses, Laser Beam, Chaotic Rays, Transfer, Annihilation Beam.

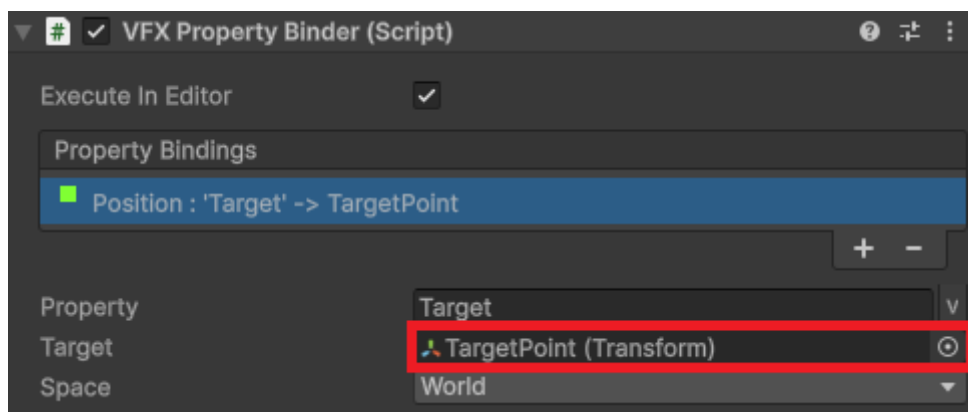

Effects with **OnPlay** event only: Lightning Strike, Scorching Lance.

Energy Bolt has these events: OnPlay, OnStop, dissipate.

Beam Prefabs

The default Prefabs are made for the fastest implementation. Simply drag and drop the Prefab into your scene and move the VFXStartPoint and TargetPoint Game Objects.

To get more flexibility, use the VFX Property Binder on the VFXStartPoint and set the Target in the Inspector to any Game Object you need. This method is used in the Demo scene.

Manual control of the beam end point

To gain complete freedom in the code, you can remove VFX Property Binder and [use the exposed property Target](#). It's Vector3 position that tells the VFX Graph where the beam should end. This way, you can calculate the end point exactly according to your needs.

Basic example:

```
using UnityEngine;
using UnityEngine.VFX;

public class VFXPropertySetter : MonoBehaviour
{
    public VisualEffect vfxGraph;
    public Vector3 targetPosition;
    public string propertyName = "Target";

    void Start()
    {
        if (vfxGraph != null)
        {
            vfxGraph.SetVector3(propertyName, targetPosition);
        }
    }
}
```

Please don't forget to rate this asset and write a review in the Asset Store! It helps me improve a lot. I really want these packs to be the best they can be.
